

Why? Diesel

New Blastrac 1-16DB Ride-On Shot Blaster Meets Guidelines

New stringent Federal Tier-3 Guidelines for emissions standards on internal combustion engines are taken seriously at Blastrac. The new Blastrac® 1-16DB, following in the steps of its predecessor, is built to meet these federally mandated regulations.

Be aware of these EPA Regulations when considering your next purchase of a shot blasting road machine.

The Blastrac 1-16DB uses an EPA approved 49 HP diesel engine for power. Less volatile than gasoline, and with emissions inside guidelines enforced by the EPA, diesel is the fuel of choice. With cleaner diesel available, and the fuel being burned more completely in the combustion process, this engine offers greater fuel economy and less pollutants expelled into the atmosphere. In short, diesel is friendly to the environment. Couple this with the new onboard bagging system and the Blastrac 1-16DB will be at the top of your list for an environmentally, and EPA friendly shot blasting machine.
